

ABSTRACT

Anatomic pathology laboratory of Dr. H. M. Rabain Hospital had difficulty in processing the data of their patient, because the storing process of the data still stored in the form of Ms.Word and also in different files. Those processes take a long time to do. In the process of searching for patient's data and reporting the data was also did manually by searching the form in the folder one by one, so the data to be searched and reported are sometimes less accurate and less complete. This hospital needs a desktop-based administration software application that can store the data of patient into the database server. Based on the results of the testin, system can store the data of patient into the database server and can create reports in the form of a table that contained in Microsoft Excel.
