

ABSTRAK

Acute stroke attack able to caused death in fast time, therefore it is needed fast, suitable and accurate handling action to save patient from death and physically also psycho disability.

Stroke management suppose to be done in a stroke unit at type A and B hospital with have applicable and proper facility and have experience doing fast and specific action.

The role of clinical practitioner and specialist in the management patient with stoke is most needed in making a prognosis in patient with stroke further more. The management will need a quite long time. Therefore in that management a continuous procedure to make a diagnostic and a therapy is needed. The length of stay of patient stroke in hospital is depend on the early and the right diagnostic and therapy that was given to the patient with stroke.

To determine kind of stroke handling action, first we need determine kind of stroke pathology by using head CT-Scan as Gold Standard Diagnose. Meanwhile if just in case head CT-Scan was unsuccessful, so Algoritma Stroke Gajah Mada (ASGM) as second alternate.
