INTRODUCTION

It has been shown by several authors¹⁻⁴ that the absorption coefficient of the visible light by the aqueous solution of the organic dyes is proportional to the square of the concentration of the dye molecules. This is in accordance with the theory of the absorption of light by a single molecule. The theory of absorption of light by a single molecule was first proposed by Lorentz⁵ and by Debye⁶. According to this theory, the absorption of light by a single molecule is proportional to the square of the concentration of the dye molecules. The theory of absorption of light by a single molecule has been modified by Debye⁶ and by Lorentz⁵ to take into account the effect of the interaction between the molecules.
